

Development Options For Web Ordering

Adding Revenue and Driving Efficiencies at the Store Level Are Key Business Reasons End Users Select to Leverage Integrated Web Ordering

Radiant System's Aloha POS allows external software integration through a flexible and scalable methodology that affords solution integrators a high level of control and flexibility. Expertise in POS operations is a requirement to achieve a reliable, capable solution.

Integrating a web ordering application to the POS requires two key components; injecting orders from a remote source to the POS without user intervention and maintaining a tightly integrated menuing strategy so that orders flow through the order process without exception.

To minimize the expertise required to successfully integrate a web ordering solution to the POS, Radiant has partnered with Lone Tree Technology to offer external web ordering solutions an easy and non-development intensive approach for integrating to the Aloha POS.

Lone Tree Technology is a software development and consulting firm serving the Hospitality Industry. Lone Tree is an Aloha Connect Partner and has over six years of experience working with Radiant's Aloha POS solution. This extensive experience has led to the creation of many integrated solutions; including the XML Order Interface product which greatly simplifies the remote ordering integration process and minimizes the POS platform specific knowledge required to integrate the applications. The XML Order Interface product supports multiple site concepts and third party solutions today.

Streamline Your Web Ordering Integration Strategy
